

Možnosti ultrazvuku v regionální anestézii

D. Mach

Musgrave Park Hospital, Royal
Victoria Hospital, Belfast, UK

ARO NMnM

Předpokládané výhody US v regionální anestézii

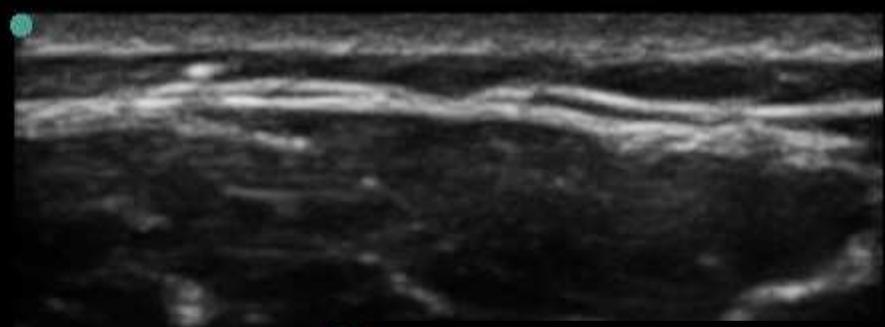

- Umožňuje **přímé zobrazení nervů a okolních tkání** (cév, svalů, kostí, fascií...)
- Umožňuje v reálném čase **zobrazení zavedené jehly** a tím zvolení (na první pokus) optimálního místa vpichu, správného směru a hloubky
- Zlepšuje kvalitu blokády, zrychluje její nástup a zvyšuje procento úspěšnosti blokády ve srovnání s neurostimulační technikou
- Snižuje počet nutných pokusů k zavedení jehly do optimálního místa a tím teoreticky dává předpoklad nižšího rizika nervového poškození
- Umožňuje (v reálném čase) **zobrazení distribuce lokálního anestetika**
- Zobrazení toku lokálního anestetika dává předpoklad časného odhalení intravaskulární injekce
- Zobrazení toku lokálního anestetika dává předpoklad časného odhalení intraneurální injekce
- Zobrazení toku lokálního anestetika dává předpoklad snížení celkové nutné dávky lokálního anestetika

Limitace neurostimulace

- Neurostimulace je užitečná jen tam, kde můžeme vyvolat motorickou odpověď
- Neurostimulace poskytuje jen nepřímou a bohužel ne zcela spolehlivou informaci o poloze nervu
- Motorická odpověď vymizí po podání prvních ml lokálního anestetika
- Motorická odpověď získaná při < 0.5 mA nemůže zaručit úspěšný a kompletní blok
- Neurostimulace není zcela spolehlivá k zabránění intravaskulární, intraneurální a intrapleurální punkce
